# 1 Introduction

Drug use is a significant risk behavior with serious health consequences for individuals and society. Multiple factors contribute to initial drug use, including psychological, social, individual, environmental, and economic elements, as well as personality traits. While legal substances like sugar, alcohol, and tobacco cause more premature deaths, illegal recreational drugs still create substantial social and personal problems.

In this data science project, we aim to identify factors and patterns potentially explaining drug use behaviors through machine learning techniques. By analyzing demographic, psychological, and social variables in our dataset, we'll aim to uncover potential predictors, use machine learning methods to understand the complex relationships surrounding drug consumption, demonstrating how machine learning can reveal insights into behavioral patterns. While our findings won't directly inform interventions, this project showcases how data-driven approaches can enhance our understanding of complex social phenomena and provide valuable practice in applying machine learning to real-world datasets.

The database contains records for 1,885 respondents with 12 attributes including personality measurements (NEO-FFI-R, BIS-11, ImpSS), demographics (education, age, gender, country, ethnicity), and self-reported usage of 18 drugs plus one fictitious drug (Semeron). Drug use is classified into seven categories ranging from "Never Used" to "Used in Last Day." All input attributes are quantified as real values, creating 18 distinct classification problems corresponding to each drug. A detailed description of the variables can be found in the Column Description text file.

## 2 Cleaning and formatting the dataset

```
# Load required libraries
library(dplyr)

##
## Attaching package: 'dplyr'

## The following objects are masked from 'package:stats':
##
##   filter, lag

## The following objects are masked from 'package:base':
##
##   intersect, setdiff, setequal, union

# Read the CSV file
drug_data <- read.csv("Data/drug_consumption.csv")
```

The original data set had all the values for most of the variables set to a random floating number representing a specific categorical value, we believe this was done in order to remove bias from the dataset. As the requirements of this project is different from the data set's original intention we had to replace these values with the original values in order to complete all the required steps for our project.

```
#####
# Define mappings and column information
#####
```

```

# Column names for the dataset

  )

#####
# Data Processing
#####

# Rename the columns
colnames(drug_data) <- column_names

# Convert demographic columns to descriptive values
drug_data$Age <- age_mapping[as.character(drug_data$Age)]
drug_data$Gender <- gender_mapping[as.character(drug_data$Gender)]
drug_data$Education <- education_mapping[as.character(drug_data$Education)]
drug_data$Country <- country_mapping[as.character(drug_data$Country)]
drug_data$Ethnicity <- ethnicity_mapping[as.character(drug_data$Ethnicity)]

# Convert all drug consumption columns to descriptive values
for (col in drug_columns) {
  drug_data[[col]] <- consumption_mapping[as.character(drug_data[[col]])]
}

#####
# Data Cleaning - Missing values
#####

# Remove unnecessary column
drug_data <- drug_data[, -which(names(drug_data) == "ID")]

# Check for NA values in each column
na_by_column <- sapply(drug_data, function(x) sum(is.na(x)))

```

```
cat("NA values by column:\n")
```

```
## NA values by column:
```

```
# Print only columns with NA values  
print(na_by_column[na_by_column > 0])
```

```
## Education Ethnicity  
##          99          83
```

```
cat("\n")
```

Only two columns contain missing values, affecting approximately 5% of the 1885 observations. Given the nature of these variables and the completeness of the rest of the data, we assume participants deliberately withheld this information. Therefore, we replaced the missing values with “Not Provided”, allowing us to treat these instances as a distinct category.
